IMPROVEMENT FOR CONTAINER THROUGHPUT IN CONTAINER TERMINAL BY ANALYSIS OF CONTAINER HANDLING DATABASE

T. SHINODA

Department of Marine Systems Engineering, Kyushu University

P. HANGGA

Graduate School of Engineering, Kyushu University
Department of Maritime Transportation, ITS - Surabaya

Seminar Nasional Teori dan Aplikasi Teknologi Kelautan (SENTA 2012)
5 Desember, 2012, Surabaya, Indonesia

Background

- Rapid growth in Container transport increases service competitiveness among Container terminals
- Need to measure terminal performance for improving service quality and customer satisfaction

Crucial question :

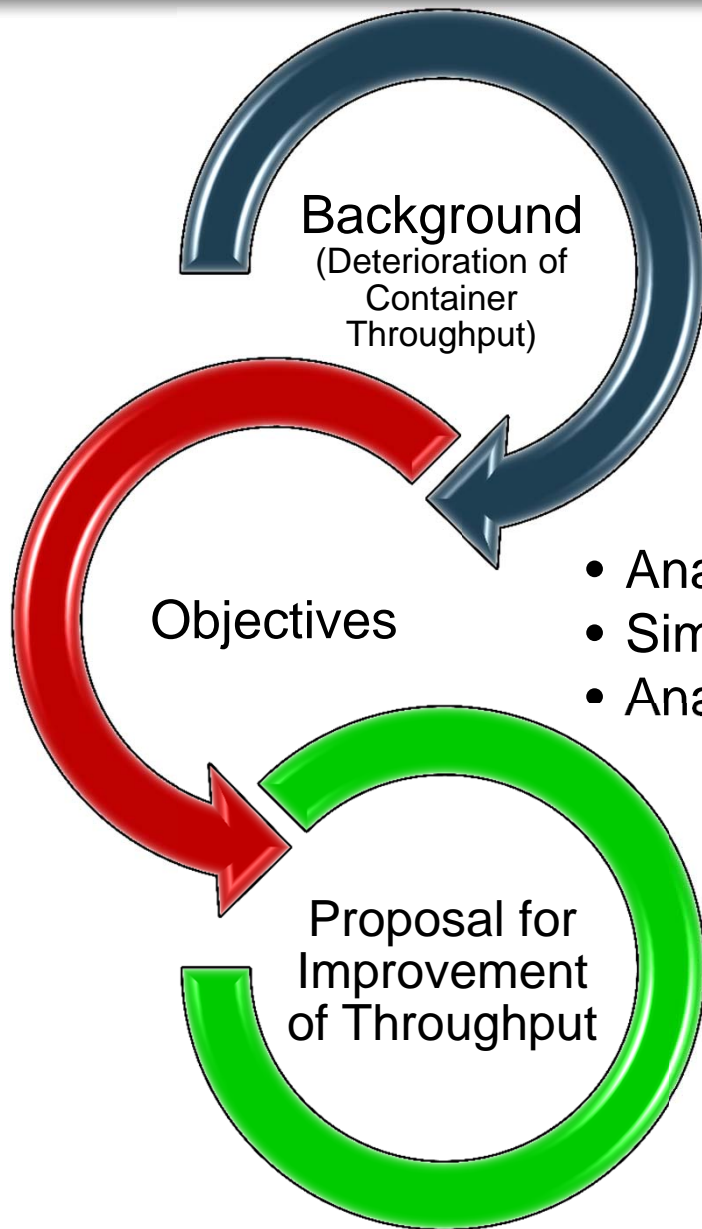

How to evaluate terminal performance ??

How to improve service quality??

Engineering or Economic Perspective??

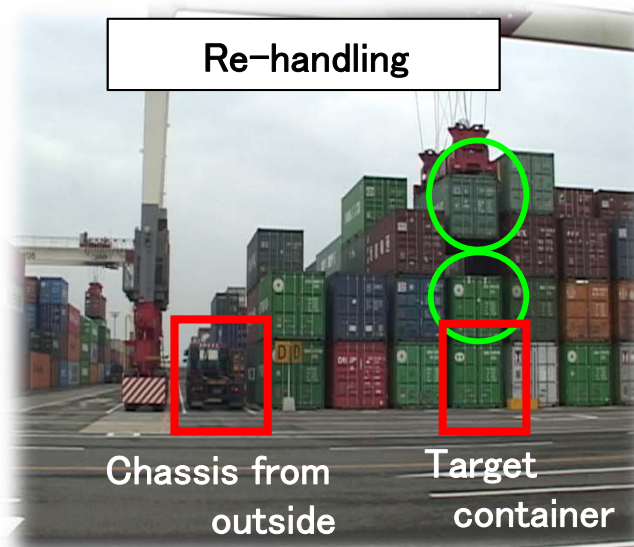

Flow of Research

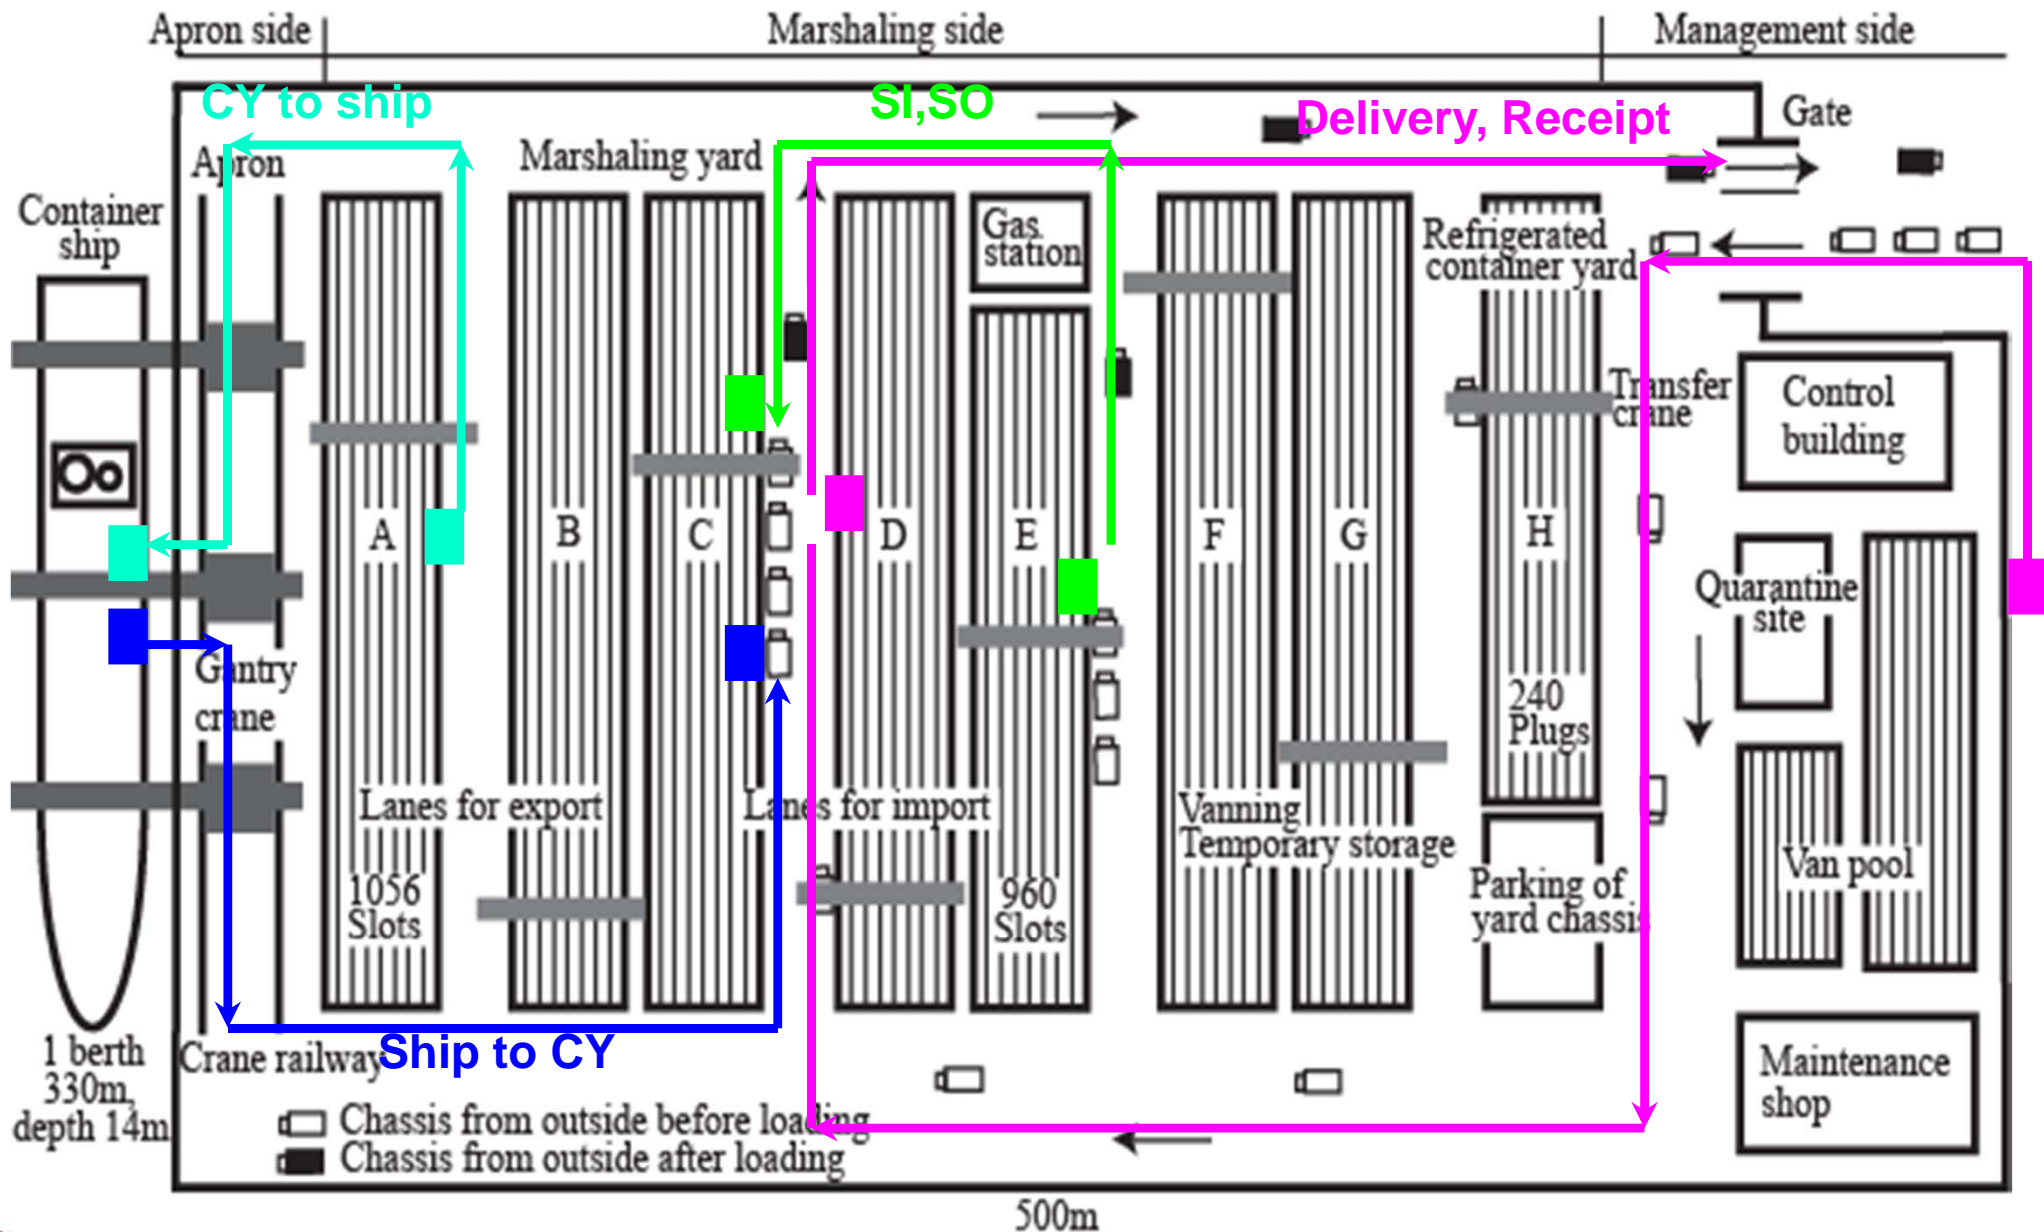

- Container Re-handling
- Queue of Chassis (C/Y) in Yard and In Front of Gate

- Analysis of re-handling operation
- Simulation of delivery operation
- Analysis of the reason for deterioration of throughput

Layout & Operation In HICCT

HICCT : Hakata Island City Container Terminal

PART I : ANALYSIS OF REHANDLING OPERATION

Target for Improvement (Handling Gear)

- RTG (Rubber Tired Gantry Crane)-able to move between lanes
- High stack capability vs Re-handling operation vulnerability

Regular load: 40. 6 tons
Hoist/wind speed 52-54m/min. (no container) 23m/min. (with container)
Traveling 70m/min., Driving 135m/min.

Analysis of Re-handling operation

- Based on Daily Work Report Information extracted from HICCT database

Daily work report of Hakata Island City Container Terminal

[Transfer crane No.7]

[Completed work data on 19:07, 13 / July / 2004 (Tue.)]

No.	Operation	G/C	Container No.	Size	From	To	Stock address	Acceptance work time	Completed work time	Wait time	Comments By HiTS	Flag
37	Ship to stock	I3	TRLU6698051	40	CY013	C115-4-4	C115-2-3	8:57	9:11	14		Ordinary completed
38	Rehandling		UGMU8050570	40	C121-1-2	C121-4-2		9:06	9:13	7		O/C
39	Delivery		EISU1316020	40	C121-1-1	TM004		9:06	9:14	8	Reserved	O/C
40	Rehandling		NYKU6057208	40	C113-5-2	C113-4-2		9:09	9:16	7		O/C
41	Delivery		TCKU9410917	40	C113-5-1	IW005		9:09	9:24	15	Reserved	O/C

45	Delivery		NYKU6112239	40	C127-1-3	MI001		9:26	9:34	8	Reserved	O/C
46	Rehandling		TGHU2538224	20	C130-8-3	C130-7-1		9:16	9:35	19		O/C
47	Delivery		FSCU3157245	20	C130-8-2	HE001		9:16	9:37	21		O/C

Remark ; The abbreviation of O/C means Ordinary completed.

Queuing time of C/Y + Working time of T/C
(except queuing time in front of gate)

- This database is re-constructed to be able to extract more useful information
- Operation work codes** list are determined
- Term of **processes in T/C operation** are defined

Work Codes & Reconstructed Database-1

Operation Work Code

Code	Denomination	Operation	Carried device from/to T/C
1	Receipt	Stack of received container	C/O
2	Delivery	Un-stack for delivery container	C/O
3	Ship-to-Stock	Stack of unloaded container	Y/C
4	Stock-to-Ship	Un-stack for loading container to ship	Y/C
5	Shift-In	Stack from other lane/slot	Y/C
6	Shift-Out	Un-stack to other lane/slot,	Y/C
7	Re-handling	Remove the obstacle containers above the target container in the same bay	None
8	Spacing	Remove the containers to make space in bay	None
9	Moving	Moving T/C between bays to catch the target container	None
10	Halt	Halt the operation of T/C	None
11	Temporary-In	Temporary stack for loading to ship	Y/C
12	Temporary-Out	Un-stack of Temporary-In container	Y/C

Remark; T/C: Transfer Crane, C/O: Chassis from outside, Y/C: Yard chassis

Database file by analyzing on daily work report and work code of T/C

Based on this database, we can determine work state transition of T/C

Term of Process in T/C Operation

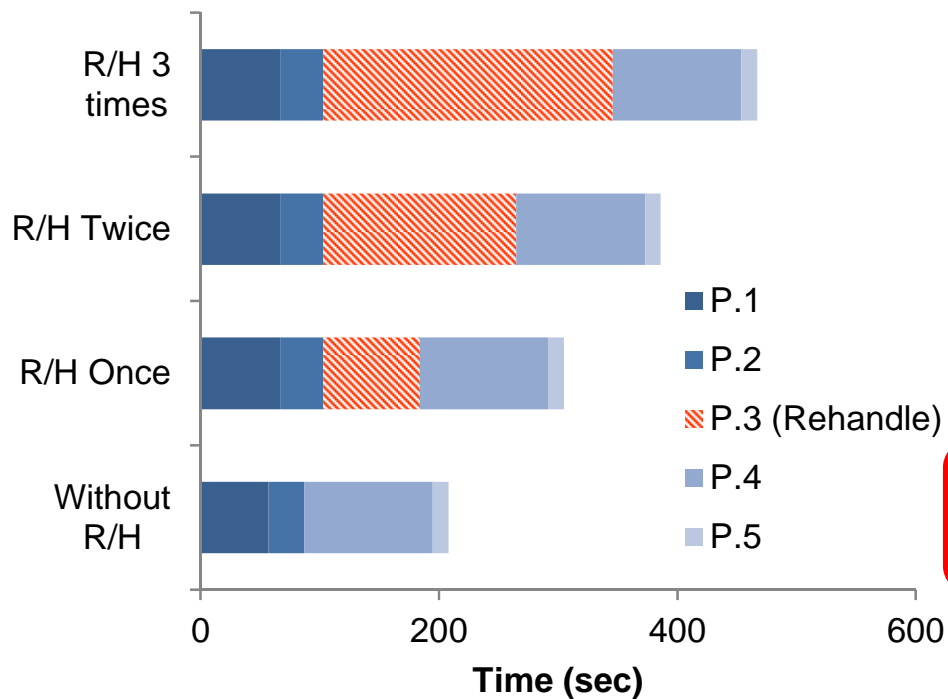

- To provide more detail analysis, step-by-step operation process is defined

Analysis of Reconstructed Database

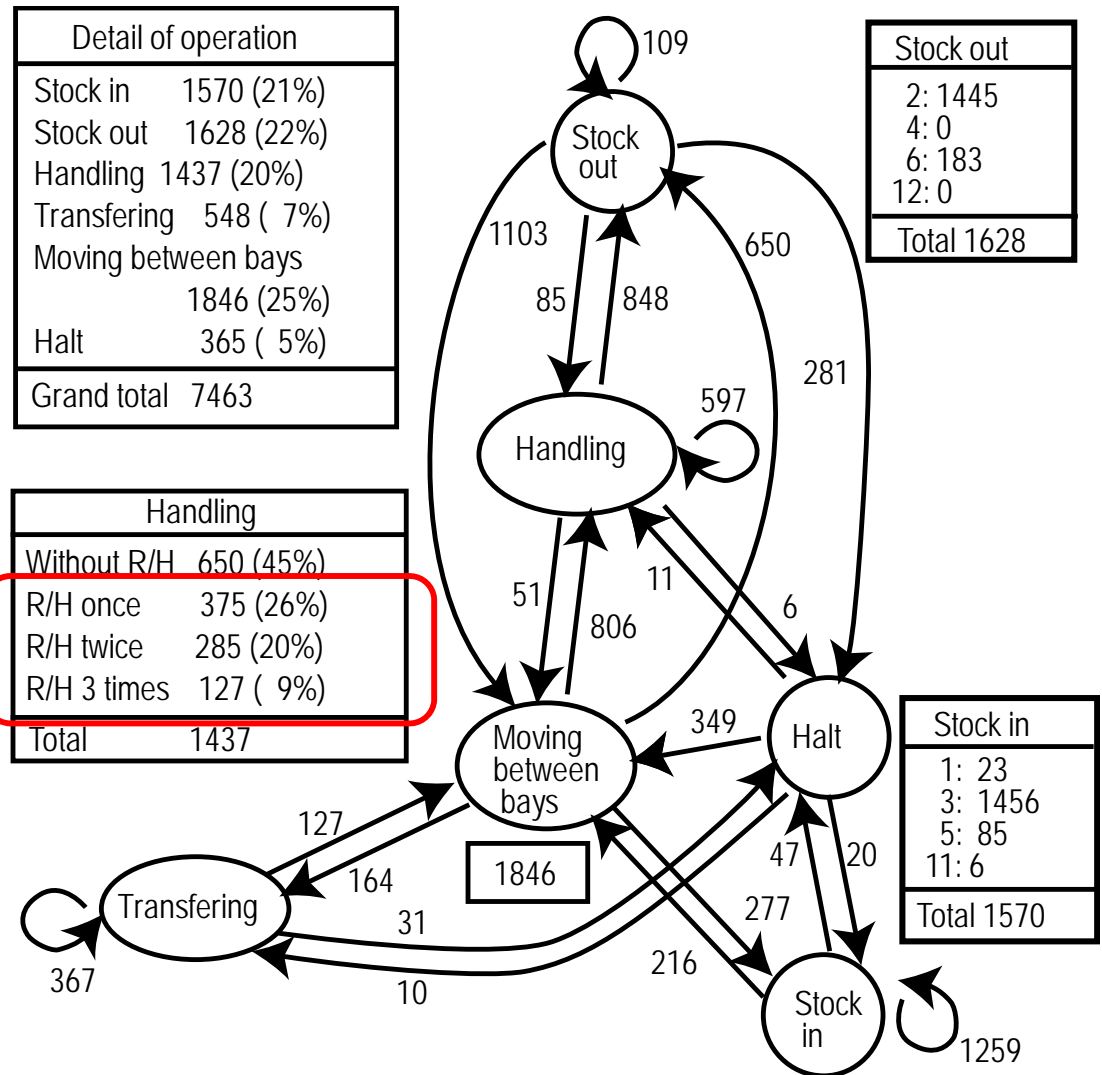

How big is Re-handling problem??

→ 55% from total handling

- P1: T/C moving to designated bay
- P2: Spreader bay-in operation
- P3: Rehandling
- P4: Spreader bay-out operation
- P5: Spreader return to initial position

Markov Chain Model of T/C Work State Transition

PART II : SIMULATION BY PETRI NET

Micro Simulation Approach for Detailed Operation

- 1. Examine the Standard Performance Specification of T/C**
- 2. Comparing Standard Time & Real Process Time**
- 3. Construction of Petri Net Simulation Modul**

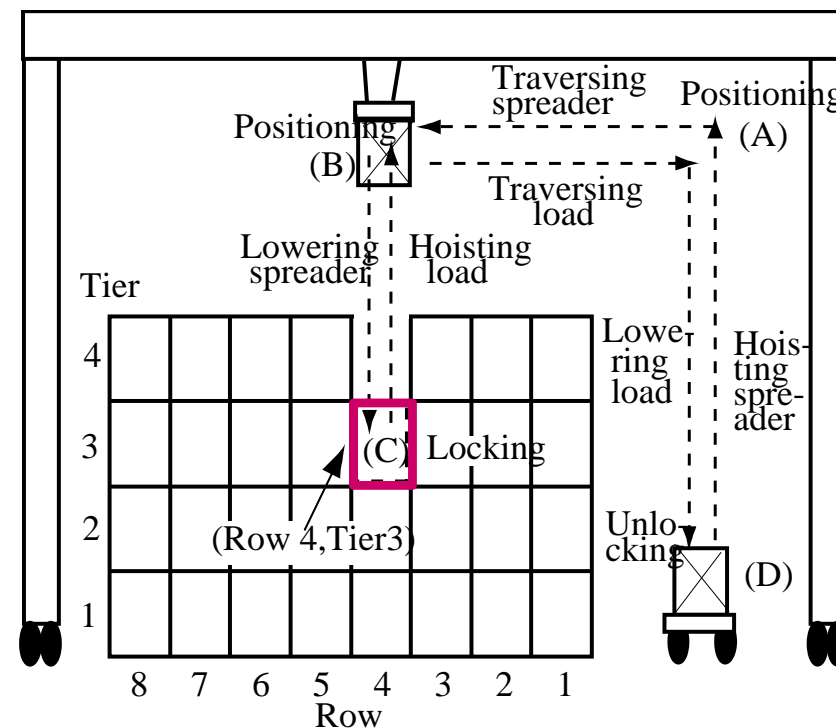

Standard Performance of T/C

- Standard performance is measured by shop test standard container delivery operation
- Standard Process time (T_{si}) defined by

$$T_{si} = \sum_{k \in i} T_{cik}(a_k, d_k) + T_{e_{ik}}$$

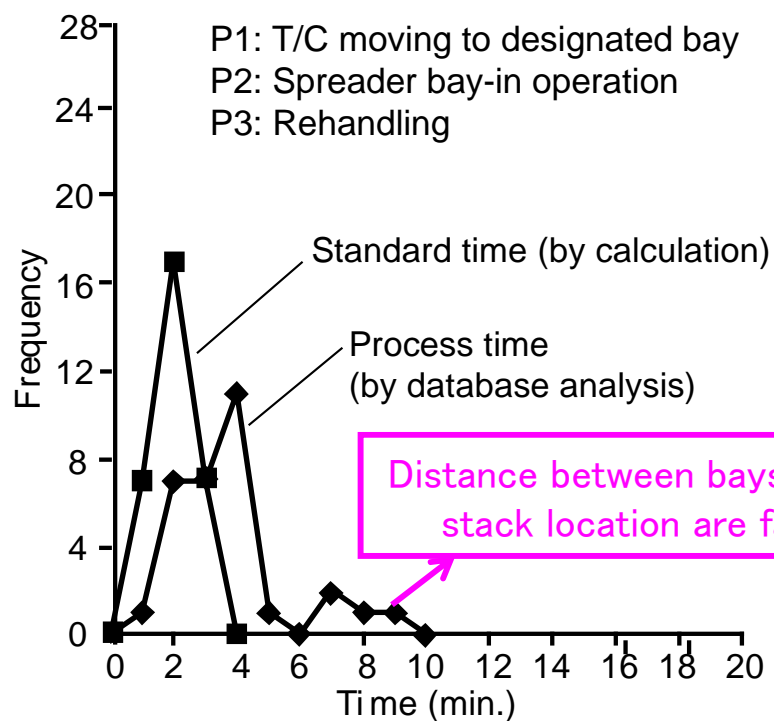

T_{cik} = sub-process time by spreader of T/C in i -th process
 $T_{e_{ik}}$ = container adjusting time in i -th process
 d_k = distance between present position and target position

i = process num.
 k = sub process num.
 a_k = acceleration

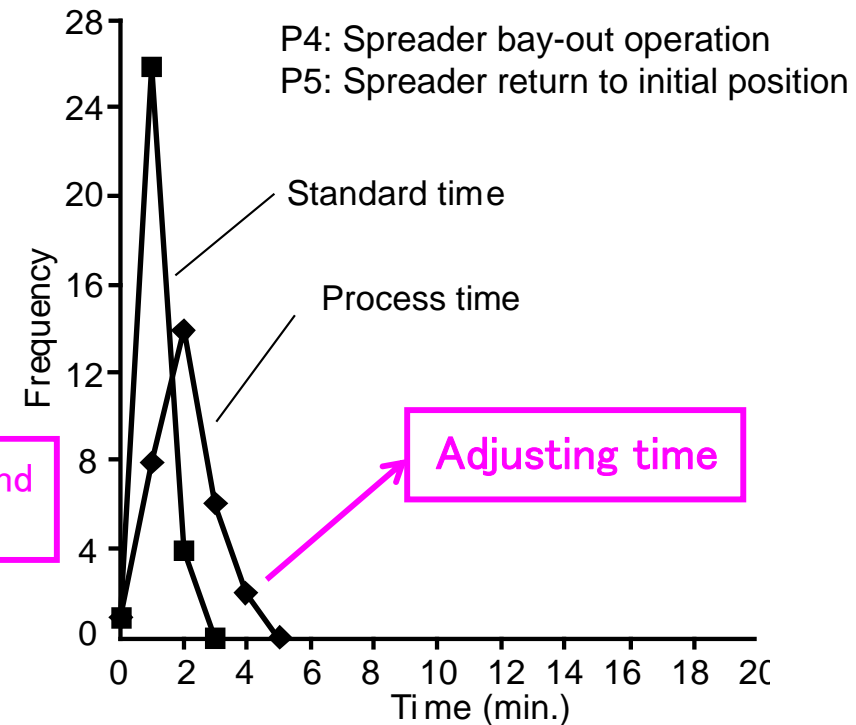

Comparison of working time (Standard. vs Real Process)

- Both diagram shapes shows good agreement and the delay of operation can be known since real process time graph is mostly behind the standard times
- The reason of this delay is mainly **driver's skill** which did not able to reached sufficient crane performance speeds.
- Some delay time has been appeared remarkably in the occasion of moving comparably long distance between and in the occasion of adjusting container with crane spreader to chassis (C/Y)

(a) Cumulated time of process 1, 2 and 3

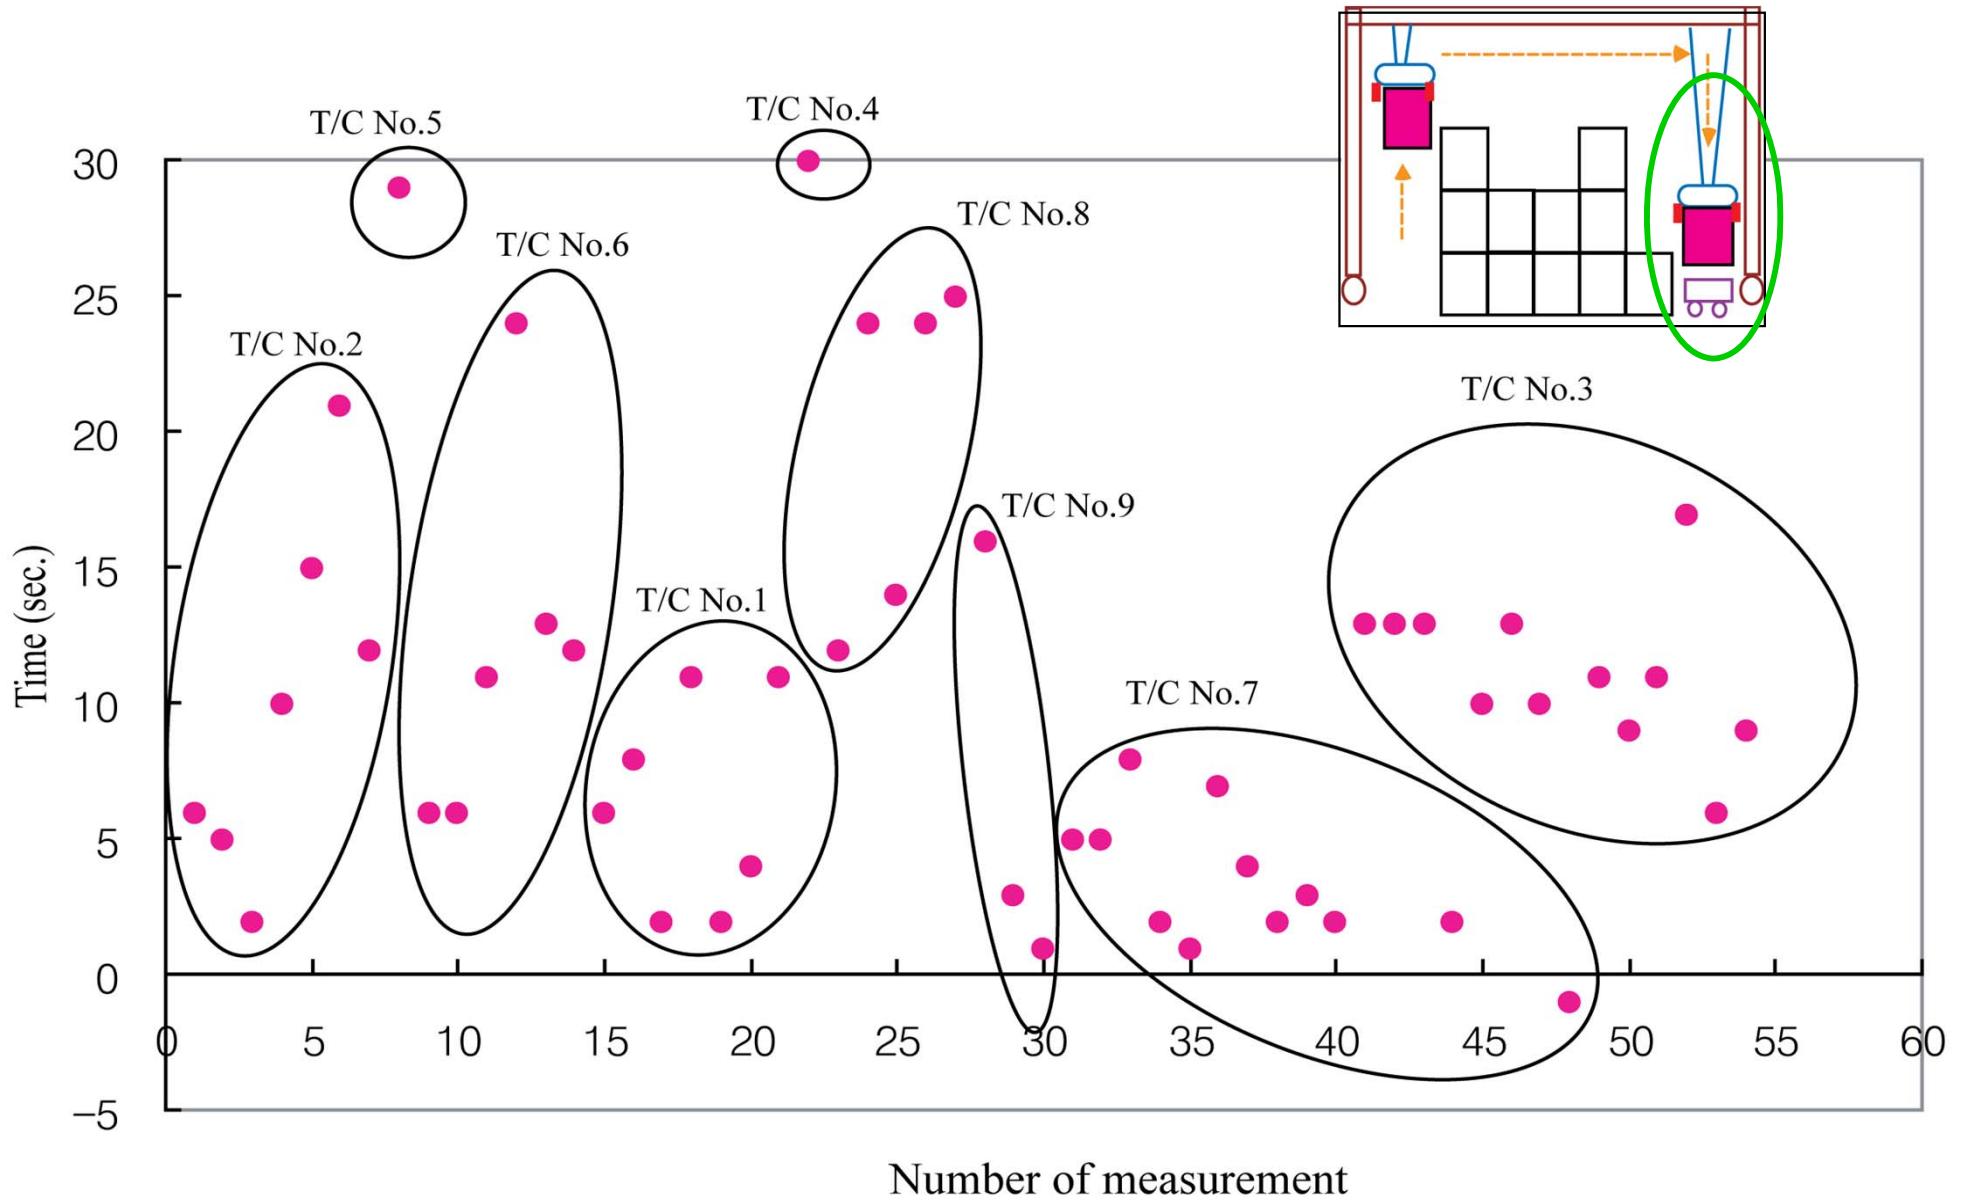

(b) Cumulated time of process 4 and 5

Remarks: Standard time : standard time which is gained by calculation

Process time : real process time which is gained by analysis of constructed database

How far adjustment time vary by frequency

Result of adjusting time that it is calculated by specification and measurement

Impact of T/C Operator's Skill

- How driver's skill influenced T/C performance in real operation

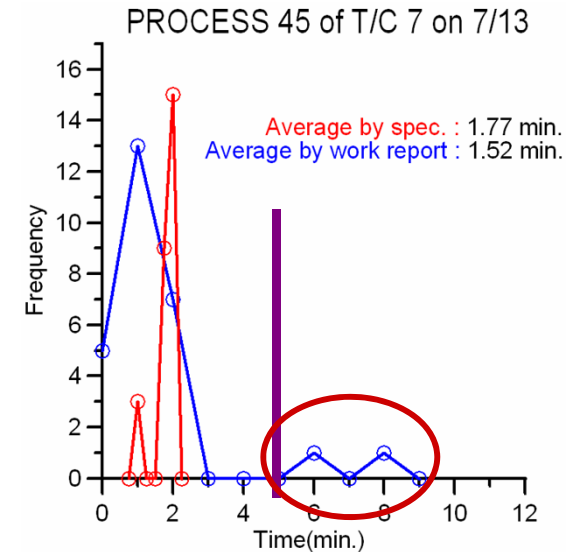

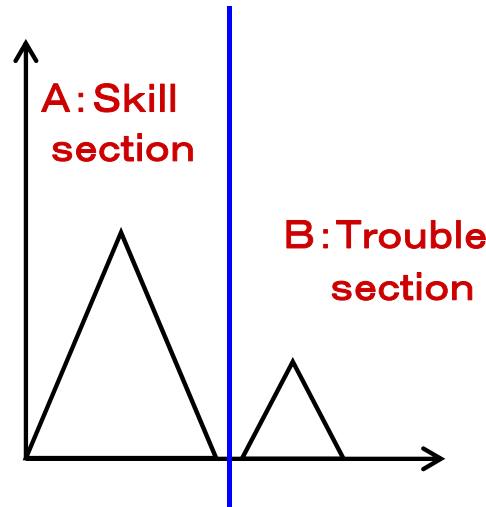

$$Tp_i = Fs_i \times Ts_i + Tt_i$$

Fs_i : i -th process's Skill factor

Ts_i : i -th process's Standard time

Tt_i : i -th process's Trouble

Skill factor (Fs_i):
 0.5 : Good 1.5 : Poor
 1 : Standard

Date	T/C No.	Fs _i : skill factor			Comparison time of standard and database				
		0.5	1.0	1.5	4.0	5.0	6.0	7.0	8.0
1st	8								
1st	9								
2nd	2								
2nd	8								
3rd	6								
5th	2								
6th	8								
7th	5								
7th	8								
8th	4								
9th	4								
10th	1								
10th	5								

Remark 1

- Driver's skill factor without trouble (driving skill of operator only)
- Driver's skill factor with trouble

Remark 2

- average standard time of average by calculation
- Average process time of with trouble by database analysis
- ▲ Average process time without trouble by database analysis

Petri Net Simulation

Petri net is a discrete model that provided constraint such as sequence of event, frequency

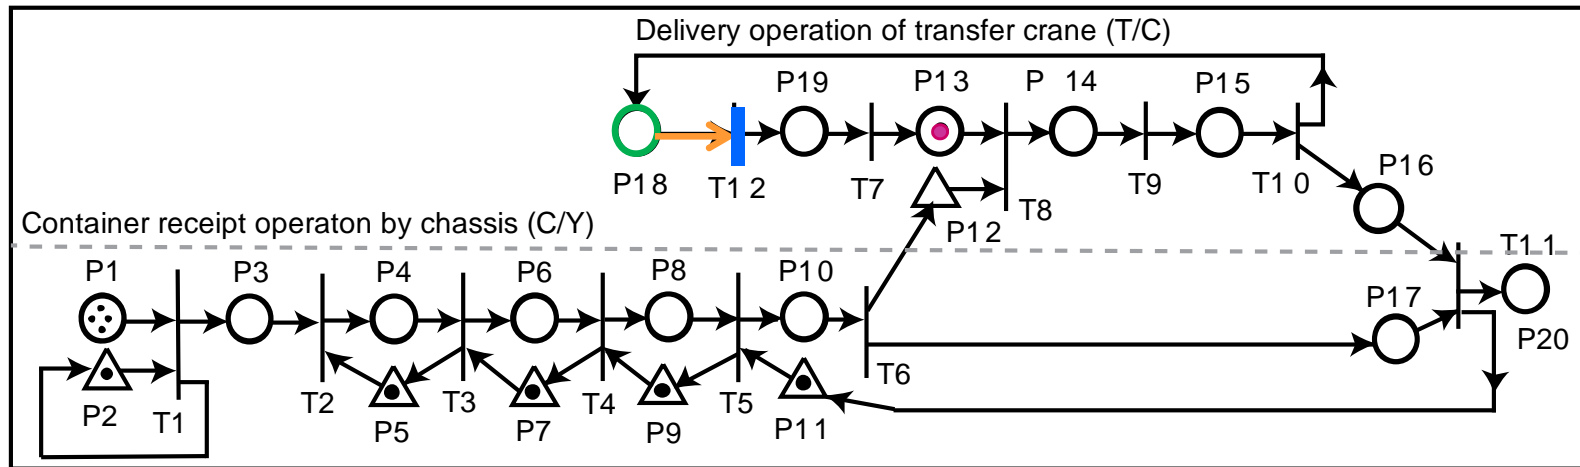

Elements of the PN

Place... State, location, information and conditions

Arc... State change flow direction arrows

Transition... State transitions, determine the conditions

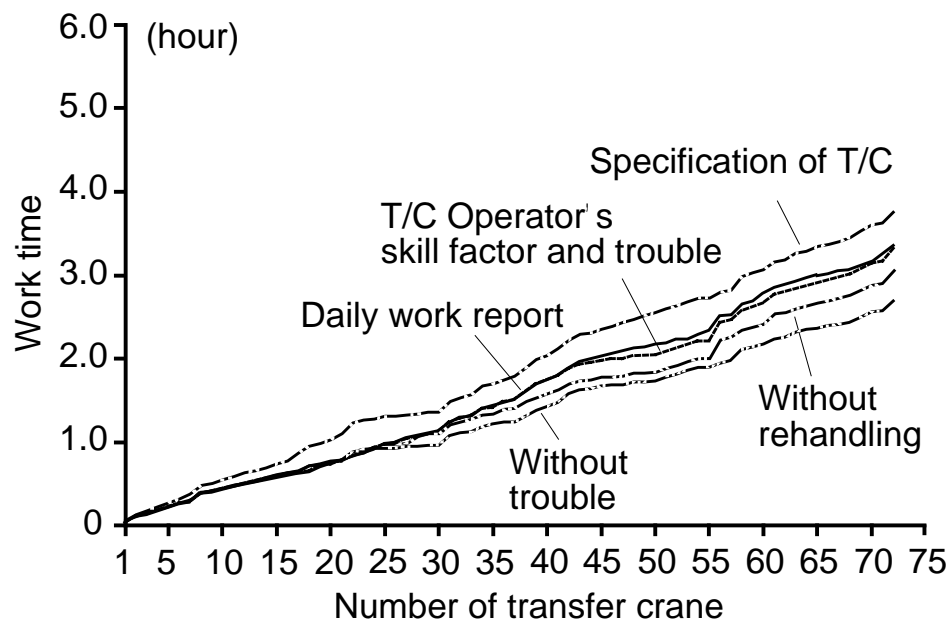

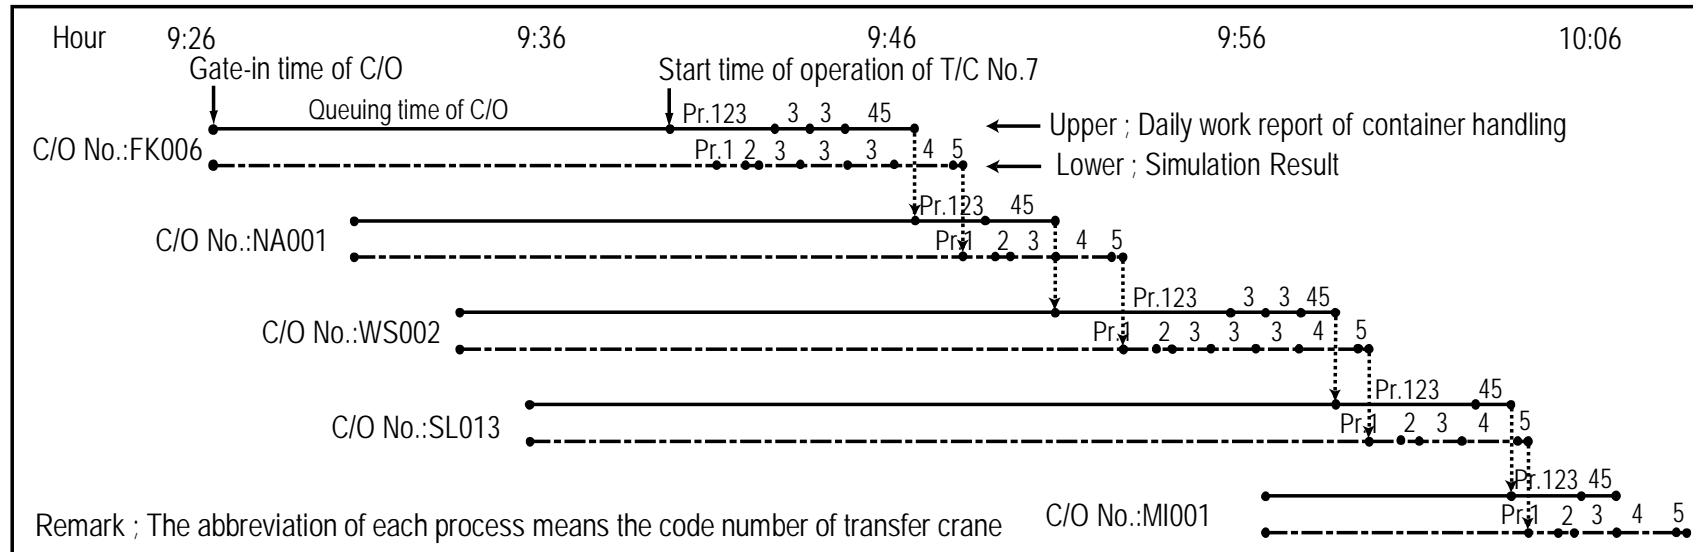

Token... State / activity.

Place No.	State of C/O	Place. No.	Operation of transfer crane
P1	Presence of C/O in front of gate	P2	Arrival of C/O
P3	Queue of C/O after pass gate	P5,P7,P9,P11	Possibility of queue of C/O in yard
P4,P6,P8,P10	Queue of C/O in yard	P12	Ready for working of C/O
P17	End of queueing to load container	Trans. No.	Operation of C/O
P20	End of loading container	T1	Moving to yard from gate
Place No.	State of T/C	T2,T3,T4,T5	Moving to the queue place
P13	End of moving to the bay for operation	T6	Moving to the bay for operation
P14	End of moving the spreader to target container	T12	Completion the operation
P15	End of rehandling operation	Trans. No.	Operation of T/C
P16	End of loading the container to C/O	T7	Moving to the bay for operation
P18	End of lowering the spreader to C/O	T8	Moving the spreader to target container
P19	End of hoisting the spreader from C/O	T9	Carrying out the rehandling operation
		T10	Lowering the spreader to C/O
		T11	Hoisting the spreader from C/O

Simulation Result

Comparison of actual time and a simulation result of transferring process of transfer crane to chassis from outside

(a) Cumulative work time of transfer crane (T/C)

(b) Cumulative wait time of chassis (C/Y)

Conclusion

- It is possible and convenient to evaluate port performance, particularly in measuring micro operation inside the terminal.
- In this research, RTG/Transfer Crane (T/S) performance were successfully evaluated by **means of operation database analysis** based on the following procedure
 - Extracting data from **daily work DB**
 - **Reconstructing new DB** and extract real process time
 - Analyze the result and **determine delay cause** (Operator Skill factor in this case)
 - **Define skill factor influence** by comparing standard and real process time
 - Construct **delivery operation model** by Petri net
 - Carry out simulation by constructed model and **examined the efficiency** with real data
- Constructed model is confirmed to be demonstrated the actual operation process appropriately and can be employed to improve efficiency especially for operation evaluation and in planning stage to decide equipment deployment in container terminal.
